

# R22 SYSTEM REPLACEMENT

**Doing nothing now is high risk to your business!**

The refrigerant known as R22 (or HCFC-22) is commonly used in air conditioning systems and several other refrigeration applications. From January 1st 2015 it will be illegal to use any hydrochlorofluorocarbon (HCFC) to service refrigeration and air conditioning equipment – so recycled or reclaimed HCFC may no longer be used. Although it is permissible to carry on using equipment that contains HCFCs beyond the phase-out date, there must be no maintenance or servicing undertaken on the equipment where it may involve breaking into the refrigerant circuits.

Now is the time to start thinking of your phase-out solutions. Time is against you. Call us now for further information.
